

Sequence Diagram: Record Service

CS 200, Team 37 · Faizan Khan, Maggie Skinner, Martin Devanathan, Tallon King, Alyssa Duncan

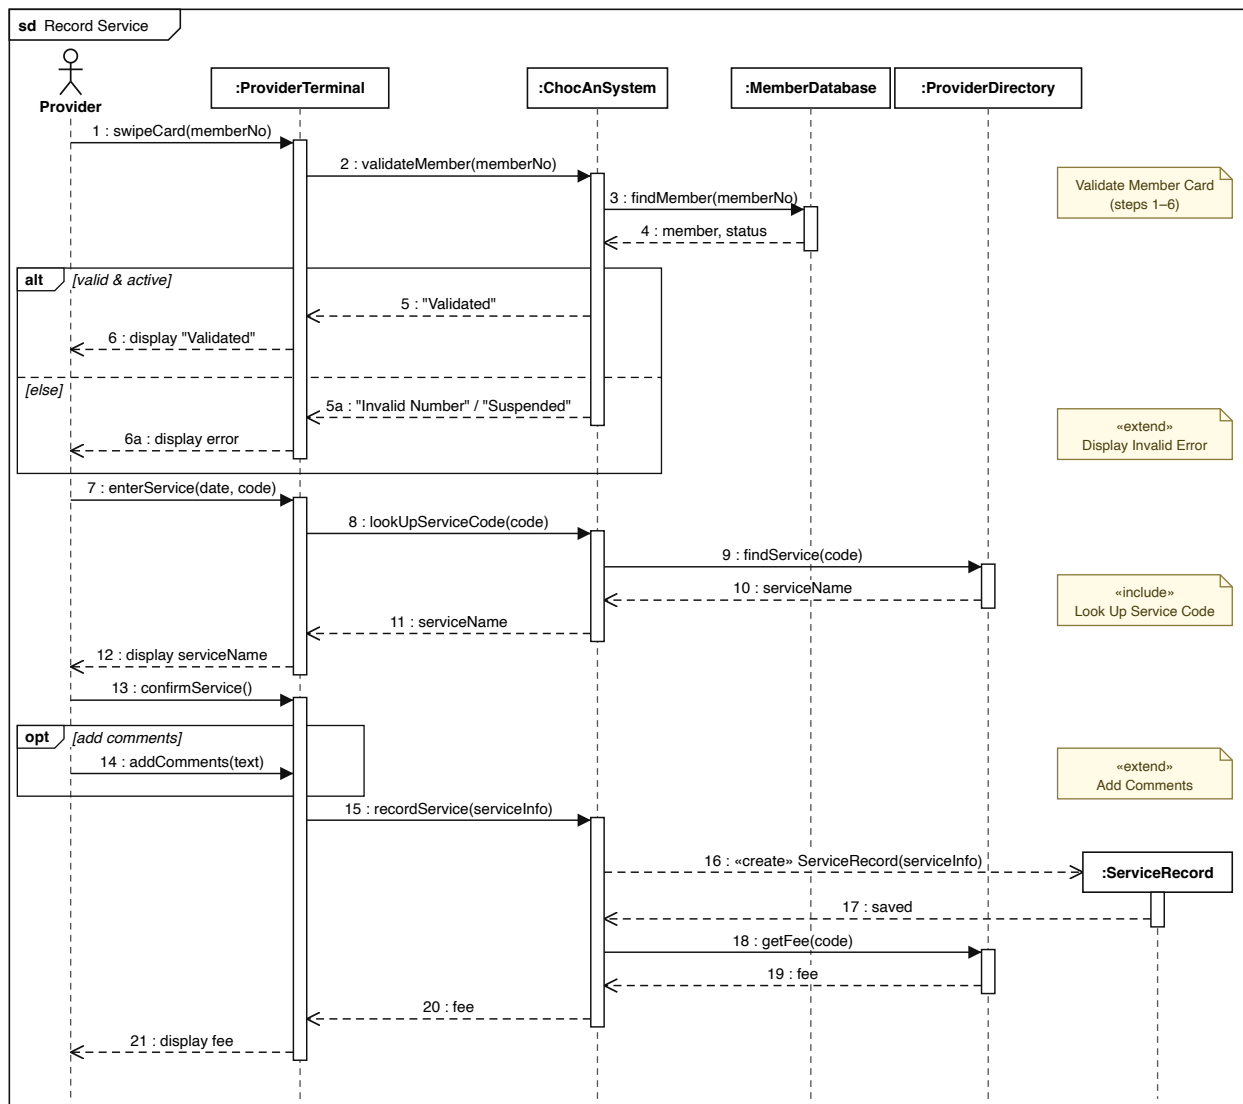

Selected Use Case

We chose **Record Service** from our Project 1 ChocAn requirements report. Actor: **Provider**. The provider validates the member's card, enters the service date and service code, confirms the service name that the system looks up, can add comments, and then the system saves a service record and shows the fee. The diagram also covers the use cases that Record Service connects to in our use case diagram: **Validate Member Card**, **Look Up Service Code** («include»), **Add Comments** («extend») and **Display Invalid Error** («extend» of Validate Member Card).

Related Classes

Provider (actor)	Healthcare professional recording a service at the terminal.	MemberDatabase	Member records and status (active / suspended).
ProviderTerminal	Boundary: reads the card and keyboard, shows messages.	ProviderDirectory	Service codes with service names and fees.
ChocAnSystem	Control: validates members, coordinates recording.	ServiceRecord	One saved service (holds <i>serviceInfo</i> , below).

serviceInfo = current date/time, service date, provider number, member number, service code, and optional comments.

Solid arrows with filled heads are calls and dashed arrows are returns. The **alt** fragment shows the extension where the member number is invalid or the member is suspended (steps 5a–6a), so the service is not recorded. The **opt** fragment is the optional Add Comments step.
